

ROYAL UNIVERSITY OF BHUTAN
COLLEGE OF SCIENCE AND TECHNOLOGY
PHUENTSHOLING: BHUTAN

PLAGIARISM DECLARATION FORM

Student Name: Divyash Chhetri

Student No: 02200174

Module No and Title of the module: CTE306 - Mobile Application Development
Assignment no and Title of the Assignment: Lab Wok 05

Section H2 of the Royal University of Bhutan's *Wheel of Academic Law* provides the following definition of academic dishonesty:

"Academic dishonesty may be defined as any attempt by a student to gain an unfair advantage in any assessment. It may be demonstrated by one of the following:

Collusion: the representation of a piece of unauthorized group work as the work of a single candidate.

Commissioning: submitting an assignment done by another person as the student's own work.

Duplication: the inclusion in coursework of material identical or substantially similar to material which has already been submitted for any other assessment within the University.

False declaration: making a false declaration in order to receive special consideration by an Examination Board or to obtain extensions to deadlines or exemption from work.

Falsification of data: presentation of data in laboratory reports, projects, etc., based on work purported to have been carried out by the student, which have been invented, altered or copied by the student.

Plagiarism: the unacknowledged use of another's work as if it were one's own.

Examples are:

- verbatim copying of another's work without acknowledgement
- paraphrasing of another's work by simply changing a few words or altering the order of presentation, without acknowledgement
- ideas or intellectual data in any form presented as one's own without acknowledging the source(s)
- making significant use of unattributed digital images such as graphs, tables, photographs, etc. taken from test books, articles, films, plays, handouts, internet, or any other source, whether published or unpublished
- submission of a piece of work which has previously been assessed for a different award or module or at a different institution as if it were new work
- use of any material without prior permission of copyright from appropriate authority or owner of the materials used"

Student Declaration

I confirm that I have read and understood the above definitions of academic dishonesty. I declare that I have not committed any academic dishonesty when completing the attached piece of work.

Department of Information Technology
College of Science and Technology

Aim

To Design UI/UX Using Adaptive Layout and implement Fragments and RecyclerView

Theory

The card view is one of the views that we must incorporate in our design. A new Android widget called CardView can be utilized to show any kind of data by giving it rounded sides and a specified elevation. A view called CardView enables many views to be stacked on top of one another. The main goal of CardView is to help the UI design feel and appear better. There are several Android applications that have this widget. You may use a CardView to add items to a listview or a recycler view. The fact that CardView extends Framelayout and can be viewed on all Android platforms is its greatest feature.

The Floating Action Button (FAB) is a frequently used user interface element in Android apps. It is a feature that resembles a circling symbol hovering above the user interface and helps users to draw attention to key components of your software. FAB draws attention to the most significant or typical tasks.

When an item scrolls off the screen, RecyclerView does not remove the item's view. On the other hand, RecyclerView makes use of the view for new objects that have scrolled across the screen. The software's performance, responsiveness, and energy use all significantly rise as a result of this recycle view.

Similar to the ListView, the RecyclerView is intended to offer listing features. But as this is done in a way that is performance-friendly. This perspective's name contains the word "Recycler" on purpose. The items that the RecyclerView is currently working with can be recycled.

A fragment in a FragmentActivity is an element of the User Interface. A fragment may be utilized in several activities, and various fragments may be combined into one action. Because we want this recycler view page to be able to slide to another page at the conclusion, we utilize this fragment.

Adaptive Layout

Program Code

activity_main.xml

```
<?xml version="1.0" encoding="utf-8"?>
<LinearLayout xmlns:android="http://schemas.android.com/apk/res/android"
    xmlns:app="http://schemas.android.com/apk/res-auto"
    xmlns:tools="http://schemas.android.com/tools"
    android:layout_width="match_parent"
    android:layout_height="match_parent"
    android:orientation="vertical"
    tools:context=".MainActivity">

    <TextView
        android:id="@+id/textView"
        android:layout_width="match_parent"
        android:layout_height="51dp"
        android:fontFamily="sans-serif-medium"
        android:text="@string/digital_menu"
        android:textAlignment="center"
        android:textColor="#3949AB"
        android:textSize="30sp" />

    <androidx.cardview.widget.CardView
        android:id="@+id/card_view1"
        android:layout_width="match_parent"

</RelativeLayout>
```

Output

Fragment 1 - Home

Fragment 2 - Notification

Fragment 3 - Profile

Conclusion

First, I learnt about cardview and adding a color gradient to buttons from the above-mentioned practical. CardView allows views to be stacked on top of one another. A floating action button on a screen carries out the primary, or most commonly, action. The user input controls were the most crucial item we learned during the practical. Interactive elements are included in interface input controls. It allows users to enter more data into the system's interface. Toggle buttons, EditText, radio buttons, and other interface input controls are some examples. These make it possible for users to readily engage with the program. I also learnt how to implement FAB and got a good understanding of how RecyclerView functions.
